Bacto-Dehydrated Media
for Microbiological Assay of
VITAMINS and AMINO ACIDS

These media contain all the necessary nutrients for the growth of specified test organisms for the microbiological assay of vitamins and amino acids except for the component under assay. These basal media require only the addition of specified increasing amounts of the vitamin or amino acid being assayed to obtain a growth response which may be measured by acidimetric or turbidimetric methods for the construction of standard curves. The vitamin or amino acid content of the material under assay is determined by adding appropriate concentrations of the test substance to the basal medium and comparing the growth response obtained with that of the standard.

BACTO-RIBOFLAVIN ASSAY MEDIUM
BACTO-NIACIN ASSAY MEDIUM
BACTO-THIAMIN ASSAY MEDIUM
BACTO-PANTOTHENATE ASSAY MEDIUM
BACTO-B₁₂ ASSAY MEDIUM USP
BACTO-CS VITAMIN B₁₂ AGAR
BACTO-FOLIC ACID ASSAY MEDIUM
BACTO-PYRIDOXINE ASSAY MEDIUM
BACTO-BIOTIN ASSAY MEDIUM
BACTO-CHOLINE ASSAY MEDIUM
BACTO-CF ASSAY MEDIUM
BACTO-TRYPTOPHANE ASSAY MEDIUM
BACTO-LEUCINE ASSAY MEDIUM
BACTO-METHIONINE ASSAY MEDIUM
BACTO-lysine ASSAY MEDIUM
BACTO-ISOLEUCINE ASSAY MEDIUM
BACTO-ARGININE ASSAY MEDIUM
BACTO-TYROSINE ASSAY MEDIUM

The method employed in carrying stock cultures of the test organisms and preparing the inoculum for microbiological assay is important. The following media have been developed especially for carrying stock cultures and for preparation of the inoculum:

BACTO-MICRO ASSAY CULTURE AGAR
BACTO-MICRO INOCULUM BROTH
BACTO-B₁₂ CULTURE AGAR USP
BACTO-B₁₂ INOCULUM BROTH USP

BACTO-VITAMIN FREE CASAMINO ACIDS, dehydrated, is an acid hydrolysate of vitamin free casein prepared especially for laboratories investigating microbiological assay of vitamins.

DIFCO LABORATORIES
DETROIT 1, MICHIGAN
How can a "Lab-aid" filing cabinet pack so much in so little space?

Look at one to see. You'll find no thick bulkheads between drawers, no space-consuming buttresses, no bulky tracking guides.

Every cubic inch inside is a hard-working "storage inch." The patented "Lab-aid" construction gets fourteen full-length drawers in a cabinet only 19" square. Yet, close-set as they are, every drawer slides straight and true, easily, smoothly, without binding.

Drawers are freely interchangeable, too. Use 1", 2", and 4" capacity full-length drawers in the same unit, in any arrangement you want, for microslides, transparencies, lantern slides, cards, etc. And use any of them anytime for spaced filing instantly. Lift out the separator, and you clear the drawers for close-packed storage.

Other units in the "Lab-aid" line provide for flat-filing microslides . . . for filing paraffin blocks, for "frame-spread" transparency filing. All are staunchly built of heavy gauge steel, strongly welded throughout. All have the same basic 19" square dimension, so they stack rigidly to any convenient height.

Write for the catalog describing these uniquely efficient "Lab-aid" filing cabinets.

... because every inch is a filing inch

NOTE TO CONTRIBUTORS

Papers are accepted for publication on condition that they are contributed solely to this Journal. Manuscripts must be typewritten, double or triple spaced, on good quality bond paper with at least one inch margins, the original copy and one duplicate submitted (figures and tables should also be submitted, if possible, in duplicate). Handwritten manuscripts or excessive interlineation is unacceptable.

References to literature, both text and bibliography, should conform with this Journal's usage. Contributors are advised to examine issues of the Journal so that their manuscripts will conform to the Journal's style as to table and figure references, citations of the literature in the text, preferred spellings, abbreviations, and so forth.

Tables will be furnished without charge to the limit of one and one-half printed pages total, charts and illustrations in black and white to the limit of four. A schedule of charges for excessive tables and figures is available on request. The cost of colored illustrations in both articles and reprints must be borne by the contributors and an estimate of such cost will be provided upon submission of the material. If important changes in data are necessary on proof, a limited number are allowed without cost, but excessive alterations and additions must be charged to the contributors.

Academic and/or hospital affiliations of each author, and an address for mailing proofs should be submitted with the article.

Reprints of articles will be furnished to contributors when ordered in advance. An order form, showing cost of reprints, is sent with proofs. BLOOD-The Journal of Hematology is published monthly.

Correspondence concerning business matters should be addressed to Grune & Stratton, Inc., Medical Publishers, Mr. Royal and Guilford Aves., Baltimore 2, Md. or 381 4th Ave., New York 16, N.Y. All communications concerning editorial matters should be forwarded to Dr. William Dameshek, Harrison Ave. and Bennett St., Boston 11, Mass.

Subscription rates, $15.00 per year within the United States, foreign, $15.00 per year; to Interns, Residents and Fellows within the United States, $9.00 per year. Single copies $1.00, foreign $2.50. May 1949 and November 1951 issues, $3.75; May 1954 issue, $5.00. Subscriptions are accepted on a calendar year basis.

Published monthly at Mount Royal & Guilford Avenues, Baltimore, Md. Entered as second-class matter January 1, 1946, at the Post Office at Baltimore, Maryland under the Act of March 3, 1879.

PAPERS TO APPEAR IN EARLY ISSUES

Distribution of Histamine Among Leukocytes and Platelets, by Helen Tredway Graham, Oliver H. Lowry, Frances Wheelwright, Miriam A. Lenz and Havner H. Parish, Jr.

Erythropoietic (Congenital) Porphyria: A Rare Abnormality of the Normoblasts, by Rudi Schmied, Samuel Schwartz and R. Dorothy Sundberg.

Studies on Abnormal Hemoglobins. XI. Sickle Cell-Thalassemia Disease in the Negro. The Significance of the S A F and the S A Patterns Obtained by Hemoglobin Analysis, by Karl Singer, Lily Singer and Seymour R. Goldberg.

Uses and Limitations of Survival Studies of Erythrocytes Tagged with CR{sup 39}, by Max M. Strumia, Lawrence Taylor, Albert B. Sample, Louise S. Colwell and Ann Dugan.
PYREX and thermal shock resistance are synonymous—and only the AO Hemacytometer is made of PYREX glass. So—in fusing AO's famed metallized surface to the counting chamber, higher temperatures for better bonding and elimination of "rub-off" can be used—because PYREX can take it!

It is this metallized surface which makes cells more clearly visible for counting and which is so effective in sharply defining the bright lines of the ruled area of the chamber. PYREX is also resistant to other shocks as well as those involving extreme temperatures. Remember—when you buy an AO Hemacytometer, you buy PYREX—and when you buy PYREX, you buy LONG LIFE!

OTHER PROVEN ADVANTAGES
- Extra long, easy-to-fill chamber plateaus
- Greater visual contrast between cells and background
- Counts made with condenser at full aperture
- Clearly defined Bright-Line double improved Neubauer ruling
- Concavity on underside prevents scratches and prolongs useful life
- Production tolerances held to those recommended by U.S. Bureau of Standards
Fast-acting therapy in...

HYLAND
NORMAL SERUM ALBUMIN (HUMAN)

READY FOR IMMEDIATE USE

A liquid, human blood fraction—ready for immediate infusion without delay for reconstitution, grouping, typing or crossmatching. Draws 3½ times its volume into circulation within 15 minutes. Space-saver package contains 50 cc. Albumin solution and complete administration set.

Important ingredient in
Folic Acid, a member of the vitamin B complex, is now recognized as being an essential nutritional element. It is a vital factor in the formation of not only red blood cells but all body cells and, therefore, is a contributing factor to normal growth.

During infancy and pregnancy, the need for Folic Acid is intensified. Certain macrocytic anemias sometimes observed during those periods are only one of many possible signs of folic acid deficiency, all promptly responding to this vitamin. Although it is found in a number of natural foods, Folic Acid is not usually present in abundance. As with other vitamins, it may be notably absent from certain diets.

When you prescribe a vitamin preparation, particularly for an infant, a growing child, or a mother-to-be, remember the established importance of Folic Acid and specify one of the many products that contain it!

Most leading pharmaceutical manufacturers, recognizing the essential nature of Folic Acid, include it in their multivitamin preparations. This message is presented in their behalf.
DADE HUMAN BLOOD SERUMS

Precision control assures absolute uniformity in every batch of DADE SERUMS*—the same high potency and fast, accurate reactions. You'll find that this consistency contributes substantially to speed and economy in your blood typing procedures. You'll find added convenience, too, in the completeness of the DADE line.

Still another reason for using DADE serums—the convenience of the exclusive "Serum Saver" vial. It speeds typing and saves serum.

*DADE SERUMS ARE PRODUCED BY DADE REAGENTS, INC., UNDER U.S. LICENSE NO. 179
Kimble Blood Sugar Tubes: Made from a borosilicate glass with an exceptional chemical durability, these tubes have excellent heat-shock resistance and will withstand many uses before becoming clouded or etched. Lines and numbers are filled with a colored glass permanently fused into the tube.

Kimble Blood Diluting Pipettes: The filler used in the lines and numbers of Kimble blood diluting pipettes is completely resistant to chemical attack (with the exception of hydrofluoric acid)! No matter how you clean or handle these pipettes, the graduated scales will remain clearly readable.

Kimble Hematocrit Tubes: The graduated scales of these new tubes are permanent. A colored filler which is as permanent as the glass itself forms the lines and numbers.

Kimble tubes and pipettes are sturdy...thoroughly annealed to withstand mechanical shock. All are individually retested for accuracy.

There is a Kimble glassware item available to fill every laboratory need. Your laboratory supply dealer is ready with complete information. Or write, if you prefer, Kimble Glass Company, subsidiary of Owens-Illinois, Box 1035, Toledo 1, Ohio.
The Hemorrhagic Disorders

A Clinical and Therapeutic Approach

MARIO STEFANINI, M.D., and WILLIAM DAMESHEK, M.D.

This comprehensive new volume does not limit itself simply to abnormalities of coagulation, to the exclusion of disturbances of the hemostatic mechanism but meets the needs of the practicing physician in his quest for complete clinical information in this field.

While recognizing that disorders of the coagulation mechanism are important (and fascinating), the authors give detailed emphasis also to the vascular, the platelet and the fibrinolytic mechanism. Thus, they utilize a broad approach—a practical one for the clinician, since a single defect as the sole cause of a given hemorrhagic disorder is unusual.

The book is profusely illustrated, including color plates, and is based on the actual study of a great number of cases from the viewpoint of the clinician and the clinical investigator. Particular stress is placed on details of therapy—a matter of importance to the practicing physician.

“New” entities, such as the fibrinolytic purpuras, the hemorrhagic disturbances of pregnancy and the puerperium, and the vascular purpuras are given thorough attention. Moreover, one chapter provides special therapeutic procedures useful in hemorrhagic disease, and an appendix presents a series of “screening tests” and other diagnostic procedures which will serve in the evaluation of most hemorrhagic disturbances.

Internist, hematologist, cardiologist, pediatrician, and other practicing physicians will find this carefully prepared new book a necessity in his reference library and of immediate value in his work.

about 350 pages, 177 illustrations, 16 in color, about $10.00

Strong evidence in support of the assumption that cobalt improves iron utilization in iron-deficiency anemia is provided by two recent investigations. In these studies, the effect of cobalt-iron administration was analyzed in a large series of premature infants. The authors conclude:

"Cobalt appears to be of value in the prevention of the early anemia of premature infants, and if iron is administered simultaneously, the risk of iron-deficiency anemia developing from the fourth month onward, is considerably reduced."

Lack of toxicity was also stressed:

"Cobalt has no toxic effects and no unfavorable influence on the weight gain in the dosages employed."

Roncovite provides a clinically proved form of cobalt-iron therapy. A 47-page analytical brochure dealing with the effects of cobalt on the blood is available to hematologists on request.

**how supplied:**

**RONCOVITE TABLETS**—enteric coated, red, each contains cobalt chloride, 15 mg.; exsiccated ferrous sulfate, 0.2 Gm.; bottles of 100. Dose: One tablet 4 times a day.

**RONCOVITE DROPS**—each 0.6 cc. contains cobalt chloride, 40 mg.; ferrous sulfate, 75 mg.; bottles of 15 cc. with calibrated dropper. Dose: 0.6 cc. daily.

STANDARD HY-LITE
IMPROVED NEUBAUER
HEMACYTOMETER CHAMBERS

FEATURES

1. BETTER CONTRAST—Chambers are of one piece construction, but the lines appear white in contrast with a dark background. This effect is accomplished by fusing RHODIUM on the glass and cutting lines into the metal.

2. EASIER READING—The sharp contrast between lines and cells makes counting easier and relieves eye strain. Fused rhodium will not peel from glass.

3. HIGHEST ACCURACY—Chambers are made to pass the National Bureau of Standards specifications and are backed by over thirty years of experience in producing counting chambers.

4. CHAMBER CHARGING INCLINE—Facilitates proper charging of the chambers and acts as a reservoir.

5. EVEN CELL DISTRIBUTION—Liquid cannot enter the ruled area until sufficient to fill the chamber has been applied whereupon it enters with one swift influx affording even distribution without air bubbles.

6. NEUBAUER RULING—Chambers employ the improved Neubauer ruling. The four hundred subdivisions of central one mm ruled area are oriented into groups of sixteen squares by a translucent line.

HEMACYTOMETER COVER GLASSES

To insure the correct cubic capacity of a counting chamber it is important that the cover glass be plane. Standard cover glasses are made from thick glass which is ground and polished optically plane to the proper thickness, 0.4 to 0.6 mm. Guaranteed to pass National Bureau of Standards Specifications.

Consists of a standard type hemacytometer case with one No. 40705 Yellow Backed Corrected* blood pipette for red counts, one No. 40745 Yellow Backed Corrected* blood pipette for white counts, and a Standard Hy-Lite counting chamber with two hemacytometer cover glasses.
