The references for the editorial "Thalassemia" or What's in a Name, by Dameshek in the March issue were unfortunately omitted. They are appended herewith.

Why Raudixin is safer than reserpine for the treatment of hypertension

Note that the sedative effect of Raudixin in the usual daily dose range in hypertension is far less than that of reserpine. This explains why Raudixin is much less likely than reserpine to cause excessive sedation and depression. At the usual daily dose, the hypotensive effect of Raudixin and reserpine is substantially the same.

For this reason, the safer drug --- RAUDIXIN is the drug of choice in hypertension.

The usual initial dose of Raudixin is 100 mg. b.i.d. This may be gradually increased or decreased as needed.

Supply: 50 and 100 mg. tablets, bottles of 100 and 1000.

Featuring HEMATOLOGY

Second Edition

By

CYRUS C. STURGIS, M.D.
Professor of Internal Medicine
Chairman of Department of Internal Medicine
University of Michigan Medical School

Every page of the book has been carefully scrutinized and many revisions inserted, along with suitable deletions. Includes these significant advances: Isolation and identification of vitamin B₁₂ in treatment of pernicious anemia. Introduction of the folic acid antagonists, triethylene melamine and nitrogen mustards, ACTH and cortisone, in the treatment of Leukemia and allied conditions. Therapeutic effectiveness of ACTH and cortisone in idiopathic thrombocytopenic purpura and acquired hemolytic anemia. Clarification of the indications for splenectomy. Widening of our knowledge concerning drugs as etiologic agents in hematologic disorders, especially aplastic anemia and agranulocytosis.

1240 pages 79 illustrations $19.50

CHARLES C THOMAS PUBLISHER SPRINGFIELD ILLINOIS
NEW
Second Revised Edition

CONTENTS

Part One: Leading Symptoms

Headache
Chest Pain, intercostal nerves, posterior roots, afferent nerve travelling with the sympathetic, afferent vagus fibers
Abdominal Pain, mechanisms of abdominal pain, colicky pain, continuous pain, segmental abdominal pain of extra-abdominal origin
Backache, vertebral column, soft tissue
Pain in the Extremities, Dysthesia, Polyneuropathy, bone, joints, periarthritis structures, muscle, nerve, blood and lymph vessels, skin, polyneuropathy
Disorders of General Feelings, malaise, fatigue and weakness, feeling of being cold or being warm, appetite and hunger, thirst, libido
Disorders of Consciousness, sleep, syncope (fainting), coma, stupor
Vertigo, Nausea, and Vomitus
Paralysis, Incoordination, and Involuntary Movements
Cough and Dyspnea
Diarrhea and Constipation, acute diarrhea, chronic diarrhea, constipation
Hemorrhages, epistaxis, hemoptysis, hematemesis, hemoptysis, per anum, hematuria and hemoglobinuria, hemorrhages and metorrhagia, hemorrhages into the skin, occult internal hemorrhages

Part Two: Leading Signs

The General Appearance (Habitus), stature, polyneuropathy, status degenerativus, obesity and emaciation, endocrine and pseudoendocrine features, general appearance indicating various other diseases, jaundice, cyanosis, edema
Hyperthermia, Fever, and Infectious Diseases, septic fever, infectious fever, synopsia of common infections, disease due to hypersensitization, habitual hyperthermia
Respiratory System
Cardiovascular System, inspection, percussion, auscultation, palpation, roentgenologic examination, electrocardiography, etiology and nature of cardiovascular diseases
Digestive System, oral cavity, esophagus, stomach and duodenum, small intestines and colon, liver and biliary tract, pancreas, splenomegaly and miscellaneous abdominal "masses"
Hemopoietic System, the erythrocyte, leucocyte, thrombocyte, urinopoietic System, diseases with predominant plemorlem lesions, predominant tubular lesions, diseases of interstitial tissues, vascular origin, disease due to extrarenal obstruction of the urinary tract, malformations, tumors

Glycosuria

JULIUS BAUER, M.D., F.A.C.P. Clinical Professor of Medicine, College of Medical Evangelists, Los Angeles; Senior Attending Physician, Los Angeles County General Hospital; Consultant in Medicine, Long Beach Veterans Administration Hospital

PUBLISHED THIS month, the new edition of Dr. Bauer’s highly recognized volume has now been thoroughly revised and enlarged to keep his unique approach to differential diagnosis up-to-date. Of the first edition The Annals of Internal Medicine said:

“...This book can be highly praised. The author has combined with his individual approach to each subject in turn, an extraordinary display of knowledge... and there can be few living men who enjoy such evident familiarity with the medical literature of both continents... healthy attitudes pervade the well written text, which is amply illustrated with numerous case reports.... This book is an education to read and will remain an invaluable work of reference.”

“Any rational therapy must be based upon and, therefore, be preceded by a diagnosis,” says Dr. Bauer. He adds, “Differential diagnosis requires thoroughness in observation and examination of the patient, knowledge, experience and shrewdness.” His broad concern with the whole patient, rather than simply extensive tabulation of clinical and laboratory data, provides a firm foundation for this type of informed approach. This new revision will prove invaluable to owners of the previous work as well as to new readers.

The Hemorrhagic Disorders

A Clinical and Therapeutic Approach

MARIO STEFANINI, M.D., and WILLIAM DAMESHEK, M.D.

This comprehensive new volume does not limit itself simply to abnormalities of coagulation, to the exclusion of disturbances of the hemostatic mechanism but meets the needs of the practicing physician in his quest for complete clinical information in this field.

While recognizing that disorders of the coagulation mechanism are important (and fascinating), the authors give detailed emphasis also to the vascular, the platelet and the fibrinolytic mechanism. Thus, they utilize a broad approach—a practical one for the clinician, since a single defect as the sole cause of a given hemorrhagic disorder is unusual.

The book is profusely illustrated, including color plates, and is based on the actual study of a great number of cases from the viewpoint of the clinician and the clinical investigator. Particular stress is placed on details of therapy—a matter of importance to the practicing physician.

“New” entities, such as the fibrinolytic purpuras, the hemorrhagic disturbances of pregnancy and the puerperium, and the vascular purpuras are given thorough attention. Moreover, one chapter provides special therapeutic procedures useful in hemorrhagic disease, and an appendix presents a series of “screening tests” and other diagnostic procedures which will serve in the evaluation of most hemorrhagic disturbances.

Internist, hematologist, cardiologist, pediatrician, and other practicing physicians will find this carefully prepared new book a necessity in his reference library and of immediate value in his work.

378 pages, 147 illustrations, 16 in color, $11.75

Name

Address
BACTO-TRYPSIN 1% for Hemagglutination
BACTO-HEMAGGLUTINATION BUFFER

The use of trypsinized red cells in Rh determinations has improved both the sensitivity and specificity of the test making the direct procedure as reliable as the more involved indirect antiglobulin tests. Trypsin treated erythrocytes favorably influence the determination of the A, B, S, LeA, LeB and P factors as well as providing a more sensitive cell suspension for virus hemagglutination studies.

Bacto-Trypsin 1% for Hemagglutination

is a carefully standardized soluble Trypsin for conditioning erythrocytes for Rh determinations and other hemagglutination tests. Bacto-Trypsin 1% for Hemagglutination is reconstituted by the addition of Bacto-Hemagglutination Buffer solution, yielding a sparkingly clear solution equivalent in tryptic activity to a 1 per cent solution of Trypsin, Difco 1:250.

Bacto-Hemagglutination Buffer

rehydrated with distilled water is recommended for the preparation of isotonic buffered saline for use in hemagglutination studies, especially for reconstituting Bacto-Trypsin 1% for Hemagglutination and for suspending and washing erythrocytes preparatory for hemagglutination.

These reagents are supplied in companion packages containing 6 vials (10 ml.) of Bacto-Trypsin 1% and 6 vials of Bacto-Hemagglutination Buffer each sufficient for preparing 1000 ml. of buffered saline.

THE DIFCO MANUAL, NINTH EDITION,
including descriptions of these media and their use,
is available on request.

DIFCO LABORATORIES
DETOIT 1, MICHIGAN
administer
blood under pressure...
or by gravity
alternately or simultaneously with fluid

Plexitron®
Y-type expendable set

Now, with Combination Set R49, you can administer blood or fluid, alternately or simultaneously... switch from gravity flow to pressure in less than four seconds... give a pint of blood in four to five minutes. Rate of pressure transfusion depends on force and frequency of squeeze action... set cannot pump air. You can switch back to normal gravity administration at any time.

Other advantages:
- exclusive filter offers unequaled filter area and filtering efficiency
- has new-type airway cannula
- new "flashball" quickly checks vein needle position
