For the complete Blood Bank:
The largest listing of reagents in the world.
Now you have a good reason to change anticoagulants

Donor blood collected and stored in CPD is more physiologic than a unit of blood collected in ACD. From the moment of collection to the day of use, CPD blood, when compared with ACD blood, has a lower concentration of plasma hemoglobin and potassium. And, as CPD blood contains 14% less citrate ion and is 50% less acid than ACD, it is more practical in multiple transfusion therapy where citrate intoxication and acidosis may present a problem.

In component therapy, CPD gives excellent preservation of clotting factors in both fresh frozen plasma and AHF concentrate preparations.

And blood collected and stored in Fenwal CPD BLOOD-PACK Units meets all blood bank transfusion standards for 21-day anticoagulants.

CPD—a good reason to change anticoagulants today. Available only in Fenwal BLOOD-PACK Units.

†Citrate-Phosphate-Dextrose

Reprints available on request.
NOTE TO CONTRIBUTORS

Papers are accepted for publication on condition that they are contributed solely to this Journal. Manuscripts must be typewritten, in good English, double or triple spaced, on good quality bond paper with at least one inch margins, the original and one duplicate submitted (figures and tables should also be submitted in duplicate). Papers reporting human experimentation will be reviewed in accordance with the precepts established in the Helsinki Declaration. Copies of this declaration may be obtained by writing either to the American Medical Association, 535 North Dearborn Street, Chicago, Illinois, or to the Editor's office (Dr. William Dameshek, The Mount Sinai Hospital, 19 E. 89th St., New York, N. Y. 10029). Brief Reports of not more than 4-5 double spaced, typewritten pages, and especially of new or preliminary work, Letters to the Editor, Hypotheses and Brief Reviews may be submitted for prompt publication, subject to editorial review.

References to literature, both text and bibliography, should conform with this Journal's usage. Contributors are advised to examine issues of the Journal so that their manuscripts will conform to the Journal's style as to table and figure references, citations of the literature in the text, preferred spellings, abbreviations, and so forth.

Reports of experiments on human subjects should conform in general with the "recommendations guiding doctors in clinical research" as stated in the Declaration of Helsinki of the World Medical Association (1964). This includes the principle of free and informed consent by the subject. The Editors of this journal reserve the right to exclude papers otherwise acceptable when there is evidence of apparently improper experimentation on humans or inadequate information of consent by the subject, his guardians, or the school or hospital concerned.

Tables will be furnished without charge to the limit of one and one-half printed pages total, charts and illustrations in black and white to the limit of four. Excessive tables are charged for at approximately $20.00 per page, depending upon the type of material, and excessive illustrations are charged for at $10.00 each. The cost of colored illustrations in both articles and reprints must be borne by the contributors, and an estimate of such cost will be provided upon submission of the material.

Academic and/or hospital affiliations of each author, and an address for mailing proofs should be submitted with the article.

Reprints of articles will be furnished to contributors when ordered in advance. An order form, showing cost of reprints, is sent with proofs. BLOOD—The Journal of Hematology is published 12 times a year in two volumes.

Correspondence concerning business matters should be addressed to Henry M. Stratton, Inc., Medical Publishers, 381 Park Avenue South, New York, N. Y. 10016. All communications concerning editorial matters should be addressed to Dr. William Dameshek, Department of Hematology, Mt. Sinai Hospital, Fifth Avenue at 100th Street, New York, N. Y. 10029.

Subscription rates, $22.00 per year within the United States; foreign, $23.00 per year. Students, Fellows, Interns and Residents may receive a reduced subscription of $16.00 per year (a letter giving qualifying data must accompany such orders). Single copies $4.00, foreign $4.50. Supplementary issues sold at special prices obtainable on request. Subscriptions are accepted on a calendar year basis.

Changes of address notices, including both the subscriber's old and new address, should be sent at least one month in advance to the Publishers, Henry M. Stratton, Inc., 381 Park Avenue South, New York, N. Y. 10016.

Published monthly at 300 North Jefferson St., Milwaukee, Wis. 53202. Second class postage paid at Milwaukee, Wisconsin.

The effect of vitamin C on absorption of iron

In normal subjects, when results with Fero-Grad-500 were compared with that of a tablet containing controlled-release ferrous sulfate without ascorbic acid, the absorption of iron from Fero-Grad-500 was 87% greater (mean of six subjects).*

FERO-GRAD-500

Once-a-day hematinic supplies
525 mg. of Ferrous Sulfate
in Controlled-Release form

plus

500 mg. of Ascorbic Acid
to help insure
optimal iron absorption

EVEN GREATER ACCURACY FOR COULTER RBC’s, WBC’s, & MCV’s

ISOterge

SPECIALY DEVELOPED DETERGENT FOR THE COULTER COUNTER

ISOterge combines EXCELLENT DETERGENT action with the unique quality of NOT HEMOLYZING* or altering size of red cells. Used as a frequent rinse, ISOterge will insure:

- Reduced background counts
- Removal of lysing reagents and cellular debris
- Over-all cleanliness of the aperture assembly

Residual ISOterge left after cleaning poses no problem to RBC count or size.

Concentrated ISOterge: box of 4—100 ml. bottles. Makes 4 liters of solution. $16.00

Also available: ready-to-use gallon containers. $10.00 each.

*If used as directed, hemolysis will not occur for at least 24 hours.

Investigate this remarkable new Leitz Microprojector

The Leitz Microprojector facilitates group demonstration of microscope images to an extent never before possible. A completely maintenance-free light source, more intense than a carbon arc, permits projection through the full range of magnifications, including oil-immersion lenses. A special dichroic mirror reflects all usable light into the optical systems, while allowing heat radiations to bypass the specimen stage; thus, brilliant images are possible without bleaching slides or sacrificing the living specimen. Normal line current can power the Microprojector via a special power pack which has settings for 17 or 25 amps. A series of neutral density filters permits the change of light intensity without altering color balance. Plano-flatfield objectives project images with corner-to-corner sharpness. And magnification may be varied to suit the desired projection distance and image size. Write for further information or request a demonstration in your own laboratory, and see for yourself how simple, silent and maintenance-free a Leitz Microprojector can be.
New Fenwal INTEGRAL PILOT TUBE
An improved system for collecting and processing donor pilot samples

Now you can collect a sterile pilot tube sample simply, efficiently, and with absolute confidence. The new FENWAL INTEGRAL PILOT TUBE BLOOD-PACK® Unit allows a truly representative sample of the donor’s blood to be collected automatically in a completely closed system. Sterility is assured right up to the time of use. The new INTEGRAL PILOT TUBE BLOOD-PACK Unit also incorporates the Fenwal sealed and numbered SEGMENT system. This combination of identically numbered SEGMENTS and the INTEGRAL PILOT TUBE permits positive identification of the donor samples from the moment of collection through testing, processing, storage and shipping. The new INTEGRAL PILOT TUBE replaces conventional glass pilot tubes, is unbreakable, tamperproof, and compatible with existing procedures and laboratory equipment.

BLOOD-PACK®
UNIT

Ask your Fenwal Field Sales Specialist to demonstrate the advantages of this new concept in blood banking the next time he visits, or write.
They work together to leave you nothing to look forward to but perfect slides. No contaminated stain. No stain mess. No wasted time. No ruined slides.

HEMA-Tek™ Slide Stainer gives you hematologic slides automatically stained to desired intensity, dimension, and definition—slide after slide.

Slides advance through the 3 staining cycles automatically; are even dried automatically. HEMA-Tek™ Stain-Pak, specially designed to be used with HEMA-Tek Slide Stainer, releases pre-mixed, laboratory-standardized stain, buffer, and rinse onto each slide in just the right amount as the slides advance. Stain-Pak holds enough solutions for 1,000 slides. When solutions run low, you drop in a fresh Stain-Pak. You never have to handle the solutions, and the stain is triple-filtered to minimize precipitation.

The result: a slide a minute... all day long. And another laboratory procedure that's a little less adventurous, but a lot more precise. Moreover, HEMA-Tek Slide Stainer frees the technician for other duties during the automatic process.

For complete information on HEMA-Tek Slide Stainer and Stain-Pak, fill out coupon.

We also manufacture and distribute these laboratory instruments: Gammacord™ (T-3 testing), Tissue-Tek® Microtome-Cryostat, Volémétron® (automatic blood volume computer), HEMA-Tek™ Aliquot Mixer (specimen mixer).

Thrombocyten und Thrombose im elektronenmikroskopischen Bild

Electron Microscopy of Blood Platelets and Thrombosis

This monograph is the first comprehensive review of the electron microscopy of blood platelets and thrombosis. A short history of the discovery of blood platelets and thrombocytopoiesis is given in the introduction. The first part of the book describes the normal and pathological formation of blood platelets from megakaryocytes of bone marrow. The second part presents ultrastructural findings of normal blood platelets and their various pathological changes. The third part reviews recent results of electron-microscopic studies on experiment thrombosis. All findings are well illustrated; there are 81 electronmicrographs and 6 diagrams. Each chapter is concise and contains up-to-date literature references. The observations on formation, normal structure and pathology of blood platelets are classified according to predominantly functional criteria. The biochemistry of blood platelets and the physiology of coagulation are included in the discussion. Captions to figures are printed in German and English, and there is a very full English summary.

This monograph should interest morphologists, anatomists, pathologists, clinicians, hematologists and physiologists working on coagulation.
Automated blood grouping plus.

The means to perform a variety of blood group antigen-antibody techniques. Technicon's new 10-15 channel systems are not only error-free, rapid, economical, and efficient routine blood typing systems, but much more. You can perform antigen determinations such as Kidd, -M, -N, -S, -Kell, -c, -e, -c\(^t\), and others automatically. Analyze as many as 120 samples per hour; perform up to 15 tests on each sample, with a 60% savings in reagents and labor. Results appear as actual permanent deposits on a unique filter paper strip, providing easily read, reproducible, positive identification. To date, over 100,000 correlations performed. Write for brochure: Dept. O, Technicon Corporation, Ardsley, New York 10502.
2nd International Congress of the Transplantation Society

With world authorities presiding, the program day by day

SATURDAY
- Bone Marrow Transplantation
- Cancer and Transplantation
- Pregnancy and Transplantation

SUNDAY
- Kidney Transplantation
- Heart Transplantation
- Liver Transplantation
- Other Forms of Transplantation

MONDAY
- Mechanisms of Organ Rejection
- Transplantation Antigens
- Cross-Reacting Antigens in Transplantation
- Tolerance and Enhancement

TUESDAY
- Immunosuppression — Drugs and Chemicals; Radiation
- Immunosuppression — Biological (Anti-Lymphocyte Serum)
- Immunogenetics of Transplantation
- Tissue Typing in Transplantation

WEDNESDAY
- Organ Transplantation Abstracts
- Controversial Topics — New Horizons

Review Session Progress in: (summations)
- Bone marrow — Cancer — Pregnancy
- Organ Transplantation
- Immunogenetics of Transplantation
- Transplantation Immunology — Immunosuppression
- Transplantation Antigens

Human Transplantation

Edited by Felix T. Rapaport, M.D. and Jean Dausset, M.D.

This new book is the first attempt at a systematic collection of all that is currently known about tissue and organ transplantation in man. The very top world authorities in each field present their own clinical and laboratory results, and also review work done by others in that area. Because of the unusual expertise of each author, there is a wide panorama of each topic, as well as a rich and comprehensive bibliography of that particular subject.

The very latest of human organ transplantation techniques, as well as the most recent progress in experimental approaches designed to prolong the survival of tissue transplants are described in detail. Particular attention is paid to the most recent results of histocompatibility testing, to the usefulness of immunosuppressive and endocrine agents, and to the application of antilymphocyte globulin therapy to organ transplantation.

Human Transplantation will serve as a rich reference source, and as a unique blend of individualized discussions of specialized topics. It provides a comprehensive view of what is happening in human transplantation today, and where this field may be tomorrow.

CONTENTS

INTRODUCTION TO HUMAN TRANSPLANTATION:
The Histological Background of Human Transplantation; Immunological Considerations in Human Transplantation; The Genetic Basis of Human Transplantation.

ORGAN TRANSPLANTATION IN MAN
Moral and Ethical Problems in Transplantation; The Current Worldwide Status of Kidney Transplantation; Organization of the Clinical Transplant Unit; Medical Management of the Transplant Patient; Maintenance Hemodialysis and Human Transplantation; Urological Aspects of Renal Transplantation; Kidney Transplantation; Criteria for the Early Diagnosis of Renal Allograft Rejection; The Pathology of Human Renal Transplantation; Functional and Morphologic Alterations in Long-term Surviving Kidney Transplants; Hepatic Transplantation; Pulmonary Transplantation; Cardiovascular Transplantation - Present and Future; Endocrine Transplantation; Bone Marrow Transplantation; Skin Transplantation; Bone and Cartilage Transplantation; Ophthalmologic Aspects of Transplantation; Renal Heterotransplantation.

EXPERIMENTAL APPROACHES DESIGNED TO AMELIORATE THE RESPONSE OF THE HUMAN HOST TO TISSUE AND ORGAN TRANSPLANTS:
The Hu-1 system of Human Histocompatibility; Role of Blood Groups as Determinants of Human Histocompatibility; In Vivo Methods of Histocompatibility Testing and Clinical Correlations; In Vitro Methods of Cellular Histocompatibility Testing; Application of Ionizing Radiation to the Transplant Problem; Immunosuppressive Drug Therapy in Transplantation; Endocrinologic Agents in Human Transplantation; Thoracic Duct Cannulation in Transplantation; Anti-Lymphocyte Globulin in Human Renal Transplantation.

IMMUNOBIOLOGICAL HORIZONS OF TISSUE TRANSPLANTATION:
Biological Effects of Heterologous Lymphocyte Antisera; Biological Effects of Ionizing Radiation; Role of the Thymus and Other Lymphoid Organs in the Development of the Immune System; Transplantation and Pregnancy; Autoimmunity in Relation to Transplantation; Antigenic Alterations of Host Tissues during Tissue Growth; Experimental Basis of Bone Marrow Transplantation; Transplantation Antigens; Heterophile Antigens and Antibodies in Transplantation; Immunological Tolerance; Basic Principles of Preservation and Storage of Living Cells at Low Temperatures; Preservation and Storage of Blood; Preservation and Storage of Mammalian Organs; Experimental Transplantation of the Brain.

**SEMINARS IN HEMATOLOGY**—a topical journal

The following topics are being presented in current and forthcoming issues

### THROMBOSIS AND HEMOSTASIS

**INTRODUCTION** — T. H. Spat

- Biochemical Aspects of Platelet Function and Hemostasis — M. G. Davey and E. Luscher
- Platelet Proteins — R. Nachman
- Recent Concepts of the Clotting Mechanism — W. Williams
- Fibrinogen Derivatives and their Biologic Activities — E. Kovalski
- Tests of Platelet Adhesiveness and their Clinical Significance — R. C. Hartmann
- Clinical Disorders due to the Deficiency of Factor XIII — F. Duckert and O. Beck
- Hemostasis and Thrombosis — J. F. Mustard

### LEUKOCYTES

**INTRODUCTION** — D. Zucker-Franklin

- Ultra-structure of Polymorphonuclear Leukocytes — D. Zucker-Franklin
- Biochemical Aspects of Leukocytes — M. L. Karnovsky
- Detection of Transplantation Antigens in Leukocytes — J. van Rood
- Phagocytosis — M. Rabinovitch
- Eosinophils — G. Hudson
- Lysosomal Disorders Resulting in Increased Susceptibility to Infections — R. Good
- Myelopoiesis in vitro — A. V. Pisciotta and J. I. Brody
- Inherited Variations in Leukocytes — W. M. Davidson

### PORPHYRIA AND DISORDERS OF PORPHIRIN METABOLISM

**INTRODUCTION**

- The Chemistry of the Porphyrins — B. F. Burnham
- Regulation of the Synthesis of Porphyrins and Heme — S. Granick
- The Clinical Porphyrias — C. J. Watson
- The Cutaneous Porphyrias — I. A. Magnus
- Recent Studies in Acute Intermittent Porphyria — D. P. Tschudy
- The Toxic Porphyrias — F. de Matteis
- Lead Poisoning as a Disorder of Heme Synthesis — A. Goldberg

### LYMPHOCYTES

**INTRODUCTION** — R. Good

- Ultra-structure of Lymphocytes — D. Zucker-Franklin
- The Development of the Lymphoid System — R. Good, J. Finstad and O. Stutman
- The Function of Lymphocytes — H. J. Meuwissen, M.D. Cooper and Cain
- Traffic of Lymphocytes — W. L. Ford and J. L. Gowans
- Lymphocytes and Viral Disease — R. van Furth

### HAEMOLYTICANAEMIAS (British Issue)

**INTRODUCTION** — J. V. Dacie

- Haemolytic-Uraemic Syndrome — M. C. Brain
- March Haemoglobinuria — R. J. L. Davidson
- Prevention of Haemolytic Disease of the Newborn — C. A. Clarke
- Unstable Haemoglobins and the Congenital Heinz-body Anaemias — H. Lehmann
- Paroxysmal Nocturnal Haemoglobinuria — S. M. Lewis
- Drug-Induced Haemolytic Anaemias — S. M. Worlledge

A topical journal on subjects of current importance in clinical hematology and related fields, devoted to making the present status of such topics and the results of new investigation readily available to the practicing physician.

Editors: PETER A. MIESCHER, M.D. and ERNST R. JAFFE, M.D.

Clinical Endocrinology Volume II

Edited by EDWIN B. ASTWOOD, M.D., C.M., Ph.D.
Professor of Medicine, Tufts University School of Medicine;
Senior Physician, New England Medical Center Hospitals

and CARL E. CASSIDY, M.D.
Associate Professor of Medicine, Tufts University School of
Medicine; Senior Physician, New England Medical Center Hospitals

This second volume brings the subject up-to-date by presenting concise, authoritative articles by specialists on clinical subjects and on experimental work leading to a better understanding of endocrine processes.

Each of the eighty authors and co-authors who have contributed to this work is an expert in his field and has personally contributed to his subject and has a particular interest in it. They provide the latest information on each topic and also express their own studied opinions and personal experiences in daily practice. The sixty-two chapters have been grouped into seven sections — pituitary, thyroid, parathyroid, pancreas, adrenal cortex, reproductive system and selected topics. That this new work fills a definite need in our scientific literature is evidenced by the critical acclaim accorded to Volume I:

“Virtually every major area of recent progress in endocrinology receives attention, especially where new work is changing current clinical practice. The practitioner with a particular interest in endocrinology will find the volume very useful and very much to his liking.” — Arch. Int. Med.

“An excellent treatise for students and physicians with special interests in endocrinology. It should be valuable also as a reference for practicing physicians who desire to obtain a better understanding of a particular clinical problem. The field of endocrinology is expanding so rapidly that it is pertinent for books like this one to be published periodically.”

— Annals Int. Med.

IMMUNOPATHOLOGY

Mechanisms of Inflammation Induced by Immune Reactions

Edited by Prof. Dr. PIERRE GRABAR and PETER A. MIESCHER, M.D.

The fifth volume of this outstanding series presents the discussions and research reports of the foremost investigators in their respective fields. The very latest data in all areas which contributes significantly to the understanding of mechanisms involved in inflammatory immune reactions, is provided. The full contents of this book, reproduced below, indicates the wealth of information useful to the research worker, research-oriented physician and all scientists active in the broad field of Immunology.

ANTIBODY INDUCED TISSUE INJURY

Immune Complex Induced Reactions in Experimental Animals

Non-glomerular Antigen-antibody Complex Nephritis. F. J. Dixon, Th. S. Edgington and P. H. Lambert

 Mast cell-rupturing Agents in Leukocyte Lysosomes. A. Janoff

Immune Complexes in Patients

Studies on Autoimmune Disease in NZB/NZW Mice (Summary). G. A. Andres

Systemic Lupus erythematosus — Immune complex Disease? Ch. L. Christian, L. B. Hanauer and Th. Pincus

Antitissue Antibodies

Experimental Autoimmune Glomerulonephritis (EAG) Induced by Antibodies to Renal Basement Membrane. E. R. Unanue, R. A. Lerner and F. J. Dixon

Antigen-binding Leucocytes in Patients and in Insulinsensitized Animals with Delayed Insulin Allergy. K. Federlin, A. E. Renold and E. F. Plaiffer

Immune Reactions and Hepatic Alterations in Guinea Pigs Sensitized with Altered Hepatic Proteins. F. Paronetto

Discussion on the Mechanisms of Autoimmune Thyroiditis

Studies on Amyloidosis. F. Milgrom, R. T. Schultz, R. Kasikova, E. Wilesby and E. Caltins

Experimental Immune Ulcerative Colitis. B. Halpern, A. Zweibau, R. Oriol Palou and J. C. Marard

COMPLEMENT

Studies in Experimental Animals

Enzymatic Mechanisms Concerned in the Complement Induced Chemotaxis of Rabbit Polymorphonuclear Leukocytes. E. L. Becker and P. A. Ward

The Role of Complement in the Acute Inflammatory Response. A. R. Page, H. Gewurz, R. J. Pickering and R. A. Good

Complement in Human Disease

Complement Component Levels in Hereditary Angioneurotic Edema and Isolated C'2 Deficiency in Man. S. Ruddy, Ch. B. Carpenter, H. J. Müller-Eberhard and R. F. Austin

DELAYED HYPERSONSIVITY INDUCED TISSUE INJURY

Studies on the Mechanisms of Delayed Hypersensitivity. J. R. David

The Role of Macrophages and Lymphocytes in Reactions of Delayed Hypersensitivity. D. C. Duncombe, W. T. Howson and R. A. Wolstenholf

Mediators of Delayed Hypersensitivity Reactions. W. G. Spector and D. A. Willoughby

The Role of Serum Factors in the Passive Transfer of Delayed Hypersensitivity. G. L. Asherson

Comparison of the Antigen's Molecular Properties Required for Elicitation of Various Types of Allergic Tissue Damage. A. L. de Weck

Localization of Complement, Immunglobulins and Fibronagen in Skin Sites of Tubercul Reactions, Passive Cutaneous Anaphylaxis and Arthus Reaction. F. Paronetto, Y. Borel, A. Miescher and P. Miescher

Studies on the Mechanism of Lymphocyte Cytotoxicity. P. Perlmam and G. Holm

In Vitro Studies of Cellular and Humoral Immunity Induced by Tumor Allografts. K. T. Brunner, J. Mauel, J. C. Cerottini

WHO CONFERENCE ON USE OF ANTIMITABOLITES IN DISEASE ASSOCIATED WITH ABNORMAL IMMUNE RESPONSES

Introduction. H. Goodman

Immunosuppressive Therapy. R. S. Schwartz

Experimental and Clinical Experiences with Chemical Suppression of Immunity. R. A. Good

PERSPECTIVES IN LEUKEMIA

A Leukemia Society Symposium

Edited by William Dameshek, M.D. and Raymond M. Dutcher, Ph.D.

This is the first volume of a series which will be devoted to either general or specific studies dealing with leukemia and its related disorders, such as Hodgkin’s disease, lymphosarcoma and the like. “Perspectives in Leukemia” is intended to give a bird’s-eye view of the whole gamut of leukemia ranging from its incidence, its etiology, and its physiopathology to its therapy — now and presumably in the future. This Symposium comes in close relationship with the annual meeting of the American Society of Hematology. But leukemia is not hematology alone. It deals with public health problems, with veterinary medicine, with virology, with oncology, with immunology and with chemistry and chemotherapy. To know leukemia is to know much about many different areas.

Courtland Antihemophilic Factor (Human)
A potent source of AHF activity that is free of residual processing agents

This highly purified, stable, dried cryoglobulin is derived entirely from human plasma. Its fractionation by controlled freezing and thawing does not depend on chemical precipitation. Therefore, Courtland Antihemophilic Factor (Human) provides the physician with effective Factor VIII replacement for the control of hemophilic bleeding—joint and muscle hemorrhages, cuts, wounds and surgery—without introducing the possibility of troublesome side effects.

CAUTIONS: Prepared from fresh pooled plasma. Despite careful selection of donors, plasma may contain the causative agent of viral hepatitis.
CONTRAINDICATIONS: There are no known contraindications to Courtland Antihemophilic Factor (Human). Package circular available on request.
SORVALL’S RC-3 is a centrifuge with a purpose...

...A GENERAL PURPOSE

The RC-3 has justly been described as the finest general-purpose refrigerated centrifuge on the market. It can produce up to 6,975 x G with the SORVALL HG-4 Swinging Bucket Rotor. This Rotor has a maximum capacity of 2,600 ml. The RC-3’s Gyro-Action Direct Drive accepts no fewer than eleven other SORVALL Angle and Horizontal Rotors, all of which can expand their application versatility through the use of many different tubes and reducing adapters. Controls include programmed acceleration and braking, and an exclusive speed selector that permits automatic acceleration from 500 RPM to 5,000 RPM. The drive motor and refrigeration systems are of heavy-duty design for reliability in performance, and the rotor chamber has large, full-access convenience. If you have need for versatility and dependability in laboratory centrifuge separations, just write: Ivan Sorvall, Inc., Norwalk, Connecticut 06852.

Because it's not just a test—it's a patient...

Reagents for blood banking from Pfizer Diagnostics.
For the patient's sake, for your own peace of mind...

Blood Banking Reagents from Pfizer Diagnostics.

Blood banking is much more than the addition of a drop of serum to a drop of cells and then reading the result. It's a patient's well-being in your hands. That's a lot of responsibility for a technologist.

To help you shoulder some of it, Pfizer Diagnostics has been making quality blood banking reagents for almost two decades; reagents in whose sensitivity, specificity and freshness you can place your confidence.

• for Routine and Emergency Crossmatching—
  choose PFIZER COMBS & ANTISERA
  Pfizer Diagnostics Coombs Serum represents a decade of research leadership and test reliability. Pfizer blood grouping, typing and antiglobulin sera offer outstanding specificity and sensitivity ... today's first choice for optimum security in your daily tests.

• for Antibody Screening—choose HEMANTIGEN®
  The first antibody detection reagent introduced in the U.S. Used in millions of screening tests, it now has a nine-year record of continuous proven performance. HEMANTIGEN is an important part of modern blood-bank history, and is still preferred for broad antigen coverage with single vial convenience and economy. Available fresh each week.

• for ABO Serum Grouping—choose REFERENCELLS®
  Supplies all the cells needed for complete, economical ABO serum grouping, vital for testing both donors and recipients. Provides the protection of A₂ and O cells as well as A₁ and B cells. Available fresh each week.

• for Antibody Identification—
  choose PANOCOLL or COMBICELLs®
  The standard reference panels for precise antibody identification. COMBICELLs also includes screening cells, permitting combined detection and identification with one reagent.

• for Coombs Test Quality Control—choose CHECKCELL®
  The one-minute method for detecting “false negative” Coombs tests, confirming Coombs Serum reactivity and sensitivity of the test system. Another Pfizer Diagnostics contribution to technologist confidence and patient safety.
