Hereditary Disorders
of Erythrocyte Metabolism

Edited by Ernest Beutler, M.D.

This new work presents the results of a symposium organized to provide an opportunity for investigators actively concerned with problems in this field to exchange ideas. The participants were well versed in the fundamentals of the biochemistry of the human erythrocyte. Thus, most of the time was devoted to the presentation and discussion of advanced concepts and new theses about biochemical genetics of the erythrocyte. This volume offers the reader a representative insight into the actual situation of research in this most interesting field.

CONTENTS

Electrophoretic Variation in Erythrocyte Enzymes, Harry Harris, D. A. Hopkinson, Jill E. Luffman and Sandra Rapley

Acatalasemia in Japan, Shigeo Takahara

Acatalasemia in Switzerland, Hugo Aebi, Emilio Bossi, Michael Canti, Shoji Matsubara and Hedi Suter

Genetic Variation in Red Cell Galactose-1-Phosphate Uridyl Transferase, Ernest Beutler and C. K. Mathai

Methemoglobin Reductases, F. M. Huennekens, G. K. Kerwar and A. Kajita

Congenital Methemoglobinemia Due to DPNH-Diaphorase Deficiency, Edward M. Scott

The Genetics of Glucose-6-Phosphate Dehydrogenase Deficiency, Ernest Beutler

Variants of Human Glucose-6-Phosphate Dehydrogenase, Studies of Samples from New Guinea, Henry N. Kirman, Chev Kidson and Martha Kennedy

The Structure of Normal and Variant Human Glucose-6-Phosphate Dehydrogenase, Akira Yoshida

Glutathione Deficiency, H. K. Prins, J. A. Loos and C. Zurcher

Glutathione Reductase Deficiency, Hans Dierck Walter

Hereditary Spherocytosis, James H. Jandl

Pyruvate Kinase Deficiency, Kouichi R. Tanaka and William N. Valentine

Biochemical Properties of Human Erythrocyte and Leukocyte Pyruvate Kinase, Robert D. Koler, Robert H. Bigley and Peter Stenzel

Elevated ATP Levels in Human Erythrocytes, J. A. Loos, H. K. Prins and C. Zurcher

Erythrocyte Hexokinase and Hereditary Hemolytic Anemia, William N. Valentine, Frank A. Oski, Donald E. Paglia, Marjorie A. Baughan, Arthur S. Schneider and J. Lawrence Naiman

Contributions of Hereditary Disorders of Red Cell Metabolism to Human Genetics, Arno G. Motulsky

REFERENCES*

Lists of references cited in medical text are often in error; yet, many readers judge an article largely by the accuracy with which such material was originally prepared in manuscript and checked in proof. BLOOD hopes that observance of the following notes to authors will result in more accurate bibliographic information, presented in a consistent style.

Type bibliographies double-spaced under the heading, REFERENCES. See examples below. Note use of the paragraph indention. Do not underline or use all-capitals.

References should be compiled numerically according to the order of citation in the text.

Use initials for the names of cited authors rather than full first names (although full first names of female authors may be used). The abbreviation, "et al.," is permitted in text but not in lists of references.

Abbreviations for titles of medical periodicals should conform to those used in Index Medicus. (A "List of Journals Indexed in Index Medicus"—with abbreviations—is obtainable from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402, at 75 cents.) Note that BLOOD uses periods for such abbreviations.

Abbreviate book publishers' names by elimination of their initials and such designations as "Company, Inc., Bros., Ltd."

Foreign-language titles of cited books and articles should be given in the original language, followed by a precise English translation in parentheses. Pay particular attention to proper use of accents, capitalization of German nouns, and similar conventions. If the original language uses other than the Roman alphabet, simply give the title in English, followed by a parenthetical note — e.g., (in Russian).

Note that the bibliographic references should be complete, as exemplified below. Note the order of material, style of punctuation and the different use of capital letters for book and journal literature; also Ed. (editor) vs. ed. (edition), etc.

Before submitting the manuscript for publication, check bibliographic numbers and the spelling of authors' names in the text against their form in the References.

EXAMPLES

BOOK (note also handling of "edition" and, only if necessary, of exact page citation):

JOURNAL ARTICLE (note handling of multiple authorship; also use of first page of article only, not inclusive pages):

CONTRIBUTION TO BOOK (note also handling of "Editors" and "Volume"):

*Reprints of this sheet are available without cost from the Editor in Chief or the publisher.

New from Technicon...
the Automated Reagin
test for syphilis

The Venereal Disease Research Laboratory, National Communicable Disease Center, and Technicon Corporation have developed the first automated flocculation test for syphilis. One hundred determinations per hour are performed on untreated plasma or serum samples (as small as 0.1 ml). The results have a 98% agreement with the VDRL Slide test, which is the most widely used manual technique. The results of the Automated Reagin test are easily read, and they may be kept as a permanent record. For further information, write Department Z, Technicon Corporation, Ardsley, New York 10502.
Professionally Preferred...

DADE
REAGENT RED CELLS
Determine and confirm blood group identification.
Detect and classify clinically significant antibodies.
Chosen by laboratory professionals for reliability, accuracy and stability.

**REVERSE-CYTE**
A pair of known A and B Reagent Red Cells (Human) for use in serum grouping technics to confirm blood groups.

**SEARCH-CYTE (I & II)**
Reagent Red Cells (Human) of known antigenic composition, for use in the detection and tentative classification of a majority of atypical iso-antibodies.

**COOMBS CONTROL CELL**
Group O Reagent Red Cells (Human) which have been coated (sensitized) with blocking (7S) human antibodies, to provide verification of negative or doubtful Coombs tests. Valuable in Quality Control Systems in Clinical Blood Banking.

**DATA-CYTE**
A series of 11 selected Reagent Red Cells (Human) with a unique data punchcard system for swift, error-free antibody identification, including the solution of the most common "multiple antibody sample".

Dade's REAGENT RED CELLS provide the maximum stability, sensitivity, and reliability in antibody detection and identification technics.

Available through Scientific Products and leading distributors throughout the world.
Is six feet of plasma a year too much to ask of a donor?

Not at all! The Fenwal® Plasmapheresis BLOOD-PACK® System allows a donor to give more plasma in a year than the amount normally obtained from him in six and a half years using conventional collection methods. The Fenwal system is a practical, simple procedure for both blood banks and donors. It permits collection of whole blood, separation of plasma and return of the red cells to the donor while performing only one phlebotomy. And the entire process takes less than 30 minutes.* In addition, the Fenwal PLASMAPHERESIS System is further safeguarded by matching SEGMENT numbers for positive red cell identification with the donor. Additional information is available through your Fenwal representative, or by writing direct.

Because it’s not just a test—
it’s a patient...
