In the latest volume of this well-received series, outstanding authorities in their special fields again present a lucid exposition of appropriate scientific knowledge and the latest clinical developments. The reader is provided with practical and detailed information of direct clinical significance, with the emphasis on the newer technics being developed for early diagnosis of cancer.

The investigator will find assistance and stimulus for the further development of methods for early detection. For the clinician, the book affords an awareness of the newer technics available to him for early diagnosis and of the best treatment modalities now available for any given patient suffering from cancer.

The series in review:

“This third volume of the series is a stimulating discussion of the so-called breakthrough areas on the frontier of clinical cancer research. . . . It manages to encompass the interests of specialists, generalists, pathologists, surgeons, and epidemiologists. The information represents advanced concepts and technics; the volume also is valuable because of the thorough exposition of the topics covered.”—Amer. J. Clinical Pathology

“A significant effort to update practical information which is directly applicable to clinical cancer control. . . . covers a real need in our scientific literature.”—Surg., Gynec. & Obstet.

424 Pages, Illustrated, $29.75
Instructions for Contributors

General Information
Papers are accepted for consideration on the condition that they are contributed solely to this journal. Papers reporting human experimentation will be reviewed in accordance with the precepts established in the Helsinki Declaration. Copies of this declaration may be obtained by writing to the American Medical Association, 535 North Dearborn Street, Chicago, Illinois. Manuscripts and all communications concerning editorial matters should be addressed to Frederick Stohlman, Jr., M.D., St. Elizabeth’s Hospital, 736 Cambridge Street, Brighton, Massachusetts 02135.

Manuscripts
Manuscripts must be typewritten, in good English, double or triple-spaced on good quality paper with margins of at least one inch. The original and one complete copy of the manuscript must be submitted.

First Page
The first page of the manuscript should contain the following information:
(1) Title of the paper
(2) Authors’ names
(3) Authors’ affiliations
(4) Name of the institution in which the work was done
(5) Acknowledgments for research support which the authors wish to have published.
(6) Name and address of the authors to whom communications regarding the manuscript should be directed.

Abstract
The second page should contain an abstract which, in general, should be less than 200 words. The abstract should summarize the reason for the study, the methods used, the results, and the major conclusions. Do not include a summary at the end of the paper.

The remainder of the manuscript should be written as concisely as possible. Only essential references should be cited.

Tables and Illustrations
Tables and illustrations should be critically evaluated so that information contained therein is not duplicated. Only those which are essential for a clear presentation of the data should be included.

Each table should be typed on a separate sheet and appropriately numbered. Legends should be typed on the same sheets as the tables.

Diagrams, charts and other line drawings should be submitted as glossy, black-and-white photographs. These must be submitted in duplicate, but clearly legible copies may be used with the duplicate manuscript. Lettering, symbols, lines, and strippling must be clear and distinct, and the effect of possible reduction in size to fit the printed page should be considered. Each figure must be identified by number and author’s name written lightly with pencil on the back, and the top of the illustration should be indicated.

Photomicrographs and other photographic illustrations must be submitted in duplicate; copies are not acceptable.

Legends for illustrations should be typewritten, double-spaced on a separate sheet.

Tables in excess of one and one-half printed pages total will be charged for at approximately $30.00 per page, depending upon the type of material. Illustrations in excess of four are charged for at $10.00 each. The cost of colored illustrations in both articles and reprints must be borne by the contributor, and an estimate of such cost will be provided by the publisher after acceptance of the material.

References
References should be compiled numerically according to the order of citation in the text. They should be typewritten, double-spaced under the heading REFERENCES. See examples below. Note use of the paragraph indentation. Do not underline or use all capitals. Use initials for the names of cited authors rather than full first names. The abbreviation, “et al.,” is permitted in text but not in lists of references.

Abbreviations for titles of medical periodicals should conform to those used in Index Medicus. (A “List of Journals Indexed in Index Medicus”—with abbreviations—is obtainable from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, at a modest charge.) Note that BLOOD uses periods for such abbreviations. Abbreviate publishers’ names by elimination of their initials and such designations as “Company, Inc., Bros., Ltd.”

If the original language of a foreign-language title uses other than the Roman alphabet, give the title in English, followed by a parenthetical note—e.g. (in Russian). Other foreign-language titles should be given in the original language.

In the examples below note the order of material, style of punctuation, the different use of capital letters for book and journal literature, and the use of ed. (editor) and ed. (edition).

Before submitting the final draft, check the numbering and spelling of authors’ names in the list of References against the form used in the text.

Examples
BOOK (cite the exact page only if necessary; note handling of “edition”):
1. Allen, A. C.: The Kidney—Medical and

(Continued on reverse side)

JOURNAL ARTICLE (cite only first page of article, not inclusive pages):

CONTRIBUTION TO BOOK (note handling of “Editors” and “Volume”):

PROOFREADING
Contributors are provided with galley proofs and are asked to proofread them for typesetting errors. Important changes in data are allowed within reason without cost, but excessive alterations and additions must be charged to the contributor.

LETTERS TO THE EDITOR
Letters to the Editor are welcomed and will be published if appropriate. They should be typed double-spaced and, generally, should not be more than 2 typewritten pages in length.

ANNOUNCEMENTS
Announcements of meetings, conferences and the like which are of interest to the readership of Blood should be sent to the Editor at least 8 weeks before the first day of the month of issue. These items should be as concise as possible.

Announcing—a new topical journal

Seminars in Arthritis and Rheumatism

John H. Talbott, M.D., editor

Seminars in Arthritis and Rheumatism will be published quarterly, beginning January 1971, and will present in-depth reviews of one or more topics of clinical importance in each issue. The first issue, for example, will deal with Surgical Treatment.

This topical approach, covering various viewpoints important for practice, will thus afford the reader a concise and thorough understanding of each area under discussion.

In this fashion, Seminars will not compete with existing research-oriented journals, but rather will supplement and complement them to the clinician's advantage.

Drawing upon invited experts in each area to provide authoritative, timely and usable information, the journal will be edited by Dr. John H. Talbott, noted author and editor, Editor Emeritus of JAMA, and a prominent figure in American and international rheumatology.

Following are the Contents for the first issue, and topics in preparation for subsequent issues:

Vol. 1, No. 1 February, 1971

SURGICAL TREATMENT IN RHEUMATOLOGY

SURGERY OF THE SHOULDER AND ELBOW, Peter Casagrande, Buffalo
SURGERY OF THE HAND AND WRIST, Leonard Marmor, Los Angeles
SURGICAL MANAGEMENT OF THE HIP, William Harris, Boston
ARTHRITIS OF THE KNEE, Robert J. Duthie, England
SURGERY IN GOUT, Robert Linton, Boston

TOPICS BEING PREPARED FOR FUTURE ISSUES:

HEMOPHILIC ARTHROPATHIES, T. C. Kissker, Cincinnati
LYMPHOMAS AND LYMPH GLAND CHANGES IN RHEUMATOID ARTHRITIS, Lyonel Israelis, Winnipeg
MACROGLOBULINS IN RHEUMATOID ARTHRITIS, Nana Svartz, Stockholm
CLINICAL COURSE OF HYPERURICEMIA, William Beetham, Boston
TREATMENT OF IDIOPATHIC HYPERURICEMIA, Walford Fessell, San Francisco
THE LE CELL, Edmund Dubois, Los Angeles
BEDSONIA AND REITER'S SYNDROME, Ephraim Engleman, San Francisco
RAYNAUD'S PHENOMENON, Gerald Rodnan, Pittsburgh

CLINICAL MANAGEMENT OF ZYLOPRIM, Wayne Rundles and James Wyngaarden, Durham, N.C.

HEMOPHILIC ARTHROPATHIES, T. C. Kissker, Cincinnati
LYMPHOMAS AND LYMPH GLAND CHANGES IN RHEUMATOID ARTHRITIS, Lyonel Israelis, Winnipeg

Contents — Vol. 23, No. 5

Megaloblastic anaemia of pregnancy: A clinical and laboratory study with particular reference to the total and labile serum folate levels. P. G. Rae and P. M. Robb

A haematological study of patients receiving long-term treatment with trimethoprim and sulphonamide. G. C. Jenkins, D. T. D. Hughes, and P. C. Hall

Relationships between platelet function tests in normal and uraemic subjects. A. A. Hassanen, G. F. McNicoll, and A. S. Douglas

The irrelevance of adhesive platelet estimations after thrombosis. R. D. Eastham

The application of tetrazolium bioautography to the identification of folate acid derivatives. R. J. Leenings, Heather Portman-Graham, C. H. J. Swan, and J. A. Blair

A composite malignant tumour of the elderly female breast. D. M. Wayte, J. B. Stewart, and C. G. McKenzie

Sensitivity of Nocardia to trimethoprim and sulphonamides in vitro. William A. Black

Tetracycline levels in bronchial secretions. M. J. Campbell

Barbiturate blood levels found at necropsy in proven cases of acute barbiturate poisoning. Roger Gillett and Frank G. Warburton

An assessment of an automated fluorimetric blood phenylalanine technique for phenylketonuria screening and for accurate estimations. J. B. Holton and P. M. West

Noise levels in a clinical chemistry laboratory. P. D. Griffiths, R. L. Koll, and W. Taylor

Technical methods

Flexible electrophoresis applicator for use with the AutoAnalyzer in routine protein analysis. M. E. Carruthers

A simple high-speed recording colorimeter system. G. B. Tennant and J. L. Whitney

Abbott Laboratories creates Abbott Scientific Products Division.
To be of greatest service to laboratory and hospital specialists

Abbott Laboratories creates Abbott Scientific Products Division

Health Care World Wide is the dedicated, highest purpose of Abbott Laboratories and its multi-faceted divisions.

In pharmaceutical... in hospital... in pediatric... in consumer... in veterinary medicine... in agriculture... in chemicals, Abbott products and services benefit people around the world, in 156 countries.

As health care needs broaden in scope and complexity, Abbott meets the demands with successful avenues of research, with advanced technology, with broader product lines and specialized diversification.

Now—to fulfill the growing necessity for a comprehensive service to support the endeavors of hospital and laboratory professionals, Abbott blends the talents and efforts of Courtland with its full-service capabilities to achieve: ABBOTT Scientific Products Division.

The Division is designed to be of greatest assistance to you, not only in daily challenges but in the future, with the development of diagnostic and therapeutic products that represent the scientific surety of Abbott's 82 years of experience in solving continually expanding health-care requirements.

The men of science, who comprise the Abbott Research and Development Operations, are continually searching for new methods and techniques that will be of greatest value to you.

The combined research capabilities of Abbott-Courtland have already been demonstrated by their recent contributions in diagnostics: AUS-tect™ Australia Antigen—Hepatitis Associated Agent Test System, a breakthrough in the diagnosis of hepatitis; STREP-tect™, a rapid and reliable Group A Streptococcal Fluorescent Antibody Test System; and the Rubella Diagnostic Test System with Duracytes®, an accurate method for determining Rubella immunity.

Quality controlled for the performance that is demanded by the integrity of your profession, Abbott Scientific Products meet the highest standards.
Dedicated to serving the laboratory professional, the Division's technical representatives are thoroughly knowledgeable and oriented to your highly specialized requirements. They offer prompt and efficient personal assistance on all ABBOTT Scientific Products.

Abbott Scientific's Consultation Services Department complements the Division with its staff of highly skilled medical technologists who are available to assist you in your everyday efforts.

Recognizing the exciting future of diagnostic and preventive medicine as well as biological products for therapeutic use, the new ABBOTT Scientific Products Division will engage in research in these specialties. It will draw upon its own skills and research capabilities as well as those of Abbott to be of greatest service to laboratory and hospital specialists in product research and in the development of new, finer techniques to save you time, to add to your efficiency and contribute to: Health Care World Wide.
Microbiological and Serological Diagnostics:
- Rubella Test System with Duracytes®
- UTI-tect™ Bacteriuria Test System
- STREP-tect™ Group A Streptococcal Fluorescent Antibody System
- AUS-tect™ Australia Antigen—Hepatitis Associated Agent Test System

Therapeutics:
- Antihemophilic Factor VIII (Human)
- Plasmatein™ Plasma Protein Fraction (Human)
- Normal Serum Albumin (Human)

Labtubes:
- Dry Specimen and Dry Sterile Specimen (No Anticoagulants)
- Labtubes with Anticoagulants in 5, 7, and 10 ml sizes
LEUKAPHERESIS

FROM A CONTINUOUS FLOW OF BLOOD

You may also separate and collect erythrocytes and platelet-rich plasma using the Aminco Continuous-Flow CELLTRIFUGE Blood Cell Separator. The individual components can then be recombined in proportions desired or drawn off for component therapy, hepatic-coma therapy, organ transplant suppression studies or other cellular research.

The CELLTRIFUGE utilizes a series of precision peristaltic pumps to move the blood from the donor through a closed system of appropriate tubing to a centrifuge bowl where separation takes place on the basis of the different densities of the components. The instrument was developed by IBM Corp. in a program sponsored by the National Cancer Institute, National Institutes of Health. The technique and instrument are further described and illustrated in literature which Aminco will forward on request.
extensive quality through intensive research
